

gaiish

THE LANGUAGE OF HUMAN-AI COMMUNICATION · KEY CONCEPTS

Gaiish is a language humans use to optimize communication with Generative AI models. Gaiish is the language of human-AI communication. It provides a structured methodology for expressing intent, context, instructions, constraints, and desired results so humans can communicate more effectively with generative AI systems.

The six components

01 Intent What are you trying to accomplish?	02 Context What does the AI need to know?	03 Instruction What should the AI do?
04 Constraints What rules, limits, tone, format, requirements or exclusions apply?	05 Result What should the finished output look like?	06 Validation How should the AI verify the result satisfies the request?

The Gaiish sequence

Write the components in the order that makes the request reviewable: what the work is for, what the model cannot infer, the action, the boundaries, the artefact, and the check. Use only the components a task needs — a short request does not require all six.

Two frameworks

Gaiish BASIC For everyday requests and for learning the shape. 1. Goal 2. Context 3. Action 4. Output	Gaiish PRO For consequential, reviewed or handed-off work. 1. Role 2. Intent 3. Context 4. Knowledge 5. Constraints 6. Process 7. Output 8. Validation

Traditional prompt vs Gaiish prompt

TRADITIONAL PROMPT

Write a marketing plan for my company.

The topic is clear; the goal, audience, limits, artefact and definition of a usable answer are not. The model has to guess all of them.

Why the structure helps

Providing this additional structure can improve instruction adherence and reduce ambiguity: it communicates the purpose, the source material and its authority, the action, the boundaries the answer must satisfy, the shape of the artefact, and how the result should be checked. It does not guarantee a better answer, and it does not make a generated claim true — people remain responsible for verifying facts, calculations, sources and any consequential action.

Gaiish is model-independent and still developing. Write once, then communicate across generative AI models — but test the model you actually use, because context limits and instruction-following behaviour differ between models.

GAIIISH PROMPT

INTENT:
Create a practical 90-day marketing strategy.

CONTEXT:
[paste product notes and existing campaign results]
Team: one marketer half-time. Audience: private dental practices with 2-6 chairs.

INSTRUCTION:
Propose channels, messages, weekly activities and a measurement plan.

CONSTRAINTS:
Budget is \$5,000. No paid search or new engineering. Do not claim results that are not in the source material.

RESULT:
Executive summary, 90-day timeline, budget table, message examples and KPIs.

VALIDATION:
Check activities against budget and staffing, then list every assumption.

The Gaiish Dictionary: 18 terms. Gaiish terms are the components of the language; general terms are the generative-AI vocabulary a Gaiish writer needs.

Definitions

Agent GENERAL

A system that uses a model to choose steps, tools or actions toward a task.

AI Model GENERAL

A trained computational system that produces predictions or generated outputs from input data.

Constraint GAIIISH

A boundary that makes an answer acceptable: scope, limit, requirement, tone or exclusion.

Context GAIIISH

The situation, audience and source material a model needs but cannot infer.

Context Window GENERAL

The amount of input and output text a model can process in one interaction.

Generative AI GENERAL

AI systems that generate new text, images, audio, video, code or other content.

Grounding GENERAL

Connecting a model's response to supplied, retrieved or otherwise identified evidence.

Hallucination GENERAL

An unsupported or invented detail presented by a generative model as if it were reliable.

Instruction GAIIISH

The action a model should take, expressed as a clear primary verb.

Intent GAIIISH

The outcome, decision or change that makes a request useful.

Iteration GENERAL

A deliberate cycle of running, evaluating and refining a prompt or output.

Large Language Model GENERAL

A language model trained on large text datasets to predict and generate sequences of tokens.

Output Specification GAIIISH

A description of the result's artefact, fields, sections, format and useful limits.

Prompt GENERAL

The input a person or system sends to a generative AI model.

Prompt Framework GAIIISH

A repeatable shape for organising the components of a prompt.

Retrieval-Augmented Generation GENERAL

A pattern that retrieves relevant source material and supplies it to a generative model before generation.

Token GENERAL

A unit of text or other input that a language model processes.

Validation GAIIISH

A check that the result satisfies the request, evidence boundary and declared constraints.

Terms marked **Gaiish** are defined by Gaiish itself; terms marked **General** are general generative-AI vocabulary included because Gaiish writers need them. Full entries, related reading and examples for every term are at <https://gaiish.com/dictionary>.
